# Use AI-Assisted Programming Tools with Care

- **Beta Phase:** Many AI-assisted programming tools are in their early stages of development. This can mean they are **unstable** or have features that **may not work as intended**.
- **Critical Reflection:** Always **critically reflect on the results** and outputs generated by these tools. Do not accept the output as correct without understanding how it was produced.
- **Informed Usage:** Understand the underlying principles and techniques that the tool uses to generate outputs.
- **Security and Privacy:** Keep in mind **potential security and data privacy issues**, especially when working with sensitive or confidential information.
- **Learning:** Using these tools should **not replace your own learning** and development in programming. Continue to enhance your skills and knowledge to not become over-reliant on these tools.
- **Ethical and Legal Considerations:** be aware of any **licensing and intellectual property issues** related to the use of AI-generated code

# Introduction

# Generative Chat Models Workflow (w/ <https://chat.openai.com/?model=gpt-4>)

Input

How would you explain "ai-assisted programming for researchers"?

Response

AI-assisted programming for researchers is a cutting-edge approach where artificial intelligence (AI) technologies are used to facilitate and enhance the process of coding and software development, specifically catered to the needs of researchers.

This involves several key aspects:

1. **Code Suggestions and Autocompletion:** AI tools can analyze the context of the code that a researcher is currently working on and suggest potential next lines or code segments. This is like having an intelligent autocomplete feature, but for coding.
2. **Code Review and Quality Analysis:** These tools can review code to find potential errors, inefficient implementations, or deviations from coding best practices. They can provide

# Fundamentals of Prompt-based Generative Models

*instruction-based language models ([Wang et al. 2022](#))  
or example-based specification ([Brown et al. 2020](#))*

## Generative Models

- Generative language models are AI algorithms that can **generate human-like text by predicting the probability of each word or sequence of words given some starting input or context.**
- Generative language models can be used for a **wide range of applications**, such as **language translation, chatbots, text summarization, content creation, programming**, and many more.

## Prompts

- In generative language generation, prompts are usually **short pieces of text or input that a language model uses as a starting point to generate longer, coherent pieces of text.**
- Prompts can take many different forms, such as **keywords, phrases, questions, or incomplete sentences.**

# AI-Assisted Programming?

**Definition:** AI-assisted programming refers to the use of artificial intelligence to enhance various elements of programming, such as **code creation** , **testing** , **bug-fixing**  and many more

## Why should we integrate them in our programming workflow?

- With AI-assisted programming, developers can **reduce the amount of time and effort required for routine programming tasks**, allowing them to **focus on more complex and creative work**
- AI-assisted programming can also lead to **better code quality** (and standardized code), since AI algorithms can help identify potential bugs and suggest optimizations, among other things

- **datasets**  >45k,
- **metrics** ,
- **spaces** > 80k 
- ... and many more!

## Philosophy

The acceleration in Artificial Intelligence (AI) and Natural Language Processing (NLP) will have a **fundamental impact on society**, as these technologies are at the core of the tools we use on a daily basis. A considerable part of this effort currently stems in NLP from training increasingly larger language models on increasingly larger quantities of texts.

Unfortunately, the resources necessary to create the best-performing models are found mainly in the hands of big technology giants. The stranglehold on this transformative technology poses some problems, from a research advancement, environmental, ethical and societal perspective. . . .

# GitHub Copilot - Convert Comments to Code

The screenshot shows a code editor with a dark theme. At the top, there are four tabs: 'sentiments.ts', 'write\_sql.go', 'parse\_expenses.py' (which is active), and 'addresses.rb'. The active tab contains Python code. The code starts with a docstring that is a multi-line comment describing the function's purpose, including an example input string. Below the docstring, the function 'parse\_expenses' is implemented. The implementation uses 'splitlines()' to process the input string, skips lines starting with '#', and uses 'split()' to parse date, value, and currency. The parsed data is then appended to a list. At the bottom left of the editor, there is a blue button with the GitHub logo and the text 'Copilot'. At the bottom center, there is a 'Replay' button with a circular arrow icon.

```
1 import datetime
2
3 def parse_expenses(expenses_string):
4     """Parse the list of expenses and return the list of triples (date, value, currency).
5     Ignore lines starting with #.
6     Parse the date using datetime.
7     Example expenses_string:
8         2016-01-02 -34.01 USD
9         2016-01-03 2.59 DKK
10        2016-01-03 -2.72 EUR
11    """
12    expenses = []
13    for line in expenses_string.splitlines():
14        if line.startswith("#"):
15            continue
16        date, value, currency = line.split(" ")
17        expenses.append((datetime.datetime.strptime(date, "%Y-%m-%d"),
18                        float(value),
19                        currency))
20    return expenses
```

Replay

# Example: Load your dataset

You can use a dataset from HuggingFace 🙌 e.g.

<https://huggingface.co/datasets/zeroshot/twitter-financial-news-sentiment>

## Dataset card

1. The dataset holds 11,932 documents annotated with 3 labels:

```
sentiments = {  
    "LABEL_0": "Bearish",  
    "LABEL_1": "Bullish",  
    "LABEL_2": "Neutral"  
}
```

Dataset Split	Number of Instances in Split
Train	9,938
Validation	2,486

Download: [https://huggingface.co/datasets/zeroshot/twitter-financial-news-sentiment/resolve/main/sent\\_valid.csv](https://huggingface.co/datasets/zeroshot/twitter-financial-news-sentiment/resolve/main/sent_valid.csv)

Create the code with GitHub Copilot

# Example: train a classifier for sentiment prediction

load a dataset 📁

label distribution 📊

create a classifier 🌳

```
import pandas as pd
import datasets
from sklearn.ensemble import RandomForestClassifier
from sklearn.feature_extraction.text import TfidfVectorizer
from sklearn.model_selection import train_test_split
from sklearn.metrics import classification_report

"""Load a dataset from CSV file"""

"""Show the label distribution of a dataset"""

"""Map the label num to label name and use a provided dictionary"""

"""Use the map_label_num_to_name function to map the label num to label name"""

"""Create a simple random classifier using the text and the labels of the dataset.
The classifier should be trained on the training set and evaluated on the validation set"""
def create_random_forest_classifier(df):
    # Split the dataset into training and validation sets

    # Create a simple random forest classifier

def main():
    dataset =

if __name__ == '__main__':
    main()
```

# GitHub Copilot - Autofill Repetitive Code

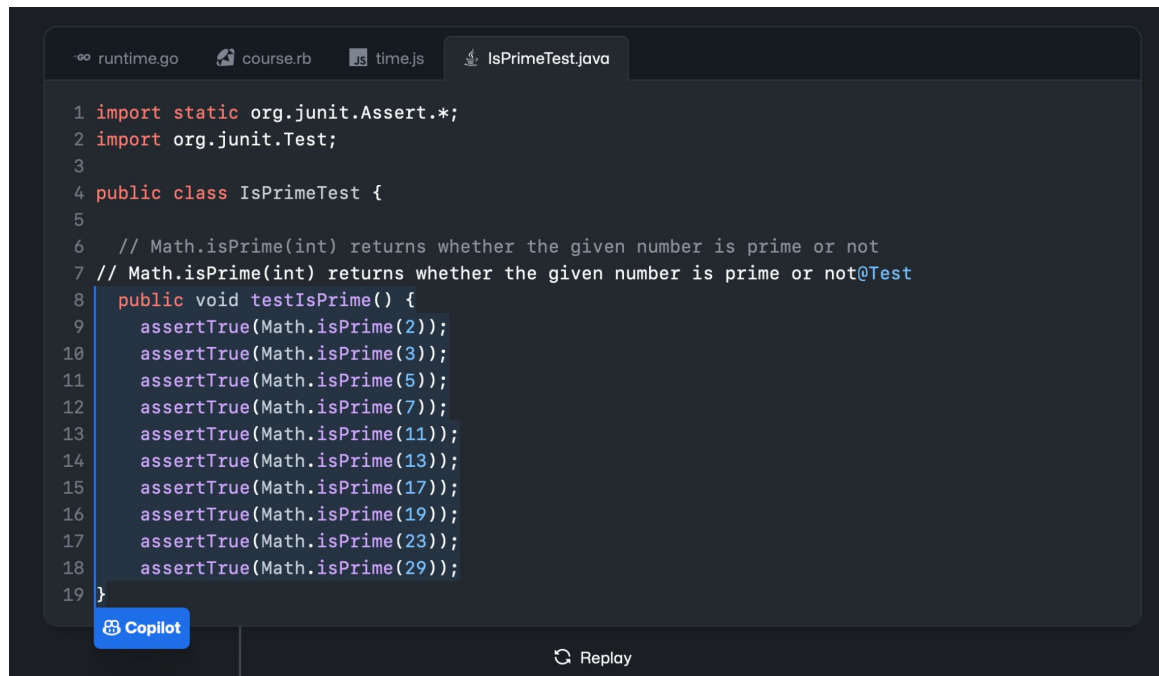

The screenshot shows a code editor with four tabs: runtime.go, course.rb, time.js (selected), and IsPrimeTest.java. The time.js tab contains the following JavaScript code:

```
1 const seconds = 3600
2 const minutes = seconds / 60
3 const hours = minutes / 60
4 const days = hours / 24
5 const weeks = days / 7
6 const months = days / 30
7 const years = months / 12
```

A blue Copilot button is visible in the bottom left corner of the editor. At the bottom center, there is a 'Replay' button with a circular arrow icon.

# GitHub Co-Pilot III - Test code

```
runtime.go course.rb time.js IsPrimeTest.java

1 import static org.junit.Assert.*;
2 import org.junit.Test;
3
4 public class IsPrimeTest {
5
6     // Math.isPrime(int) returns whether the given number is prime or not
7     // Math.isPrime(int) returns whether the given number is prime or not@Test
8     public void testIsPrime() {
9         assertTrue(Math.isPrime(2));
10        assertTrue(Math.isPrime(3));
11        assertTrue(Math.isPrime(5));
12        assertTrue(Math.isPrime(7));
13        assertTrue(Math.isPrime(11));
14        assertTrue(Math.isPrime(13));
15        assertTrue(Math.isPrime(17));
16        assertTrue(Math.isPrime(19));
17        assertTrue(Math.isPrime(23));
18        assertTrue(Math.isPrime(29));
19    }
20 }
```

TEST GENERATION

```
"""Map the label num to label name and use a provided
def map_label_num_to_name(label_num: int) -> str:
    # Set up a dictionary of label names
    label_dict: dict = {
        0: 'Bearish',
        1: 'Bullish',
        2: 'Neutral'
    }
    # Check if the label_num is not in the label_dict
    if label_num not in label_dict:
        # Raise a ValueError
        raise ValueError("Label num {} is not in the label_dict")
    # Return the label name for the given label num
    return label_dict[label_num]
```

Test generation is currently only supported for JavaScript and TypeScript.

Suggest a new test

create tests

# More chat-based alternatives w/ your own prompts

Create a test function for the following code: [code snippet]

**HuggingChat**

TabnineChat

ChatGPT

CopilotChat

and many more ...

**Unittest Code**

# HuggingChat to create tests

## Prompt:

Write a test for the following function:

```
[def map_label_num_to_name(...): ..]
```

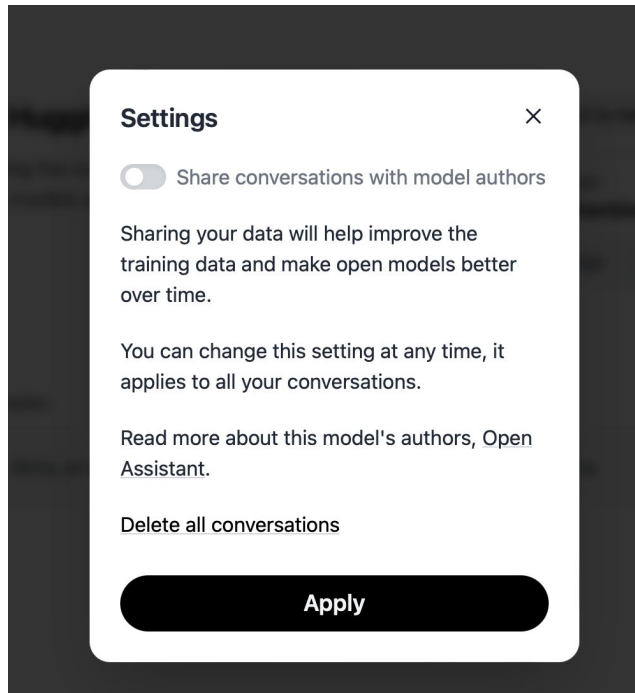

This test checks that `map_label_num_to_name` correctly maps label numbers to their corresponding labels and raises a value error if the label number is not found in the dictionary. To perform this test, you can create different input cases and check that each one returns the expected output without raising any errors. For example:

```
class TestMapLabelNumToName(unittest.TestCase):
    def test_single_case(self):
        self.assertEqual(map_label_num_to_name(0), "Bearish")

    def test_multiple_cases(self):
        # Test multiple values at once using list comprehension
        inputs = [0, 1, 2, 3, 4]
        outputs = ["Bearish", "Bullish", "Neutral", None, None]
        with self.subTest(inputs=inputs, outputs=outputs):
            for (i, input) in zip(inputs, outputs):
                try:
                    result = map_label_num_to_name(input)
                except Exception as e:
                    result = None
                self.assertEqual(result, outputs[i])

# Add more cases here...
```

# Privacy - *you don't have to share all your data*

HuggingChat

ChatGPT

Examples

# ChatGPT w/ Code Interpreter

# Write a PROMPT to load a data set and apply a classifier

Load the CSV file. First show the distribution of the labels using the following mapping:

```
label_dict = {  
    0: 'Bearish',  
    1: 'Bullish',  
    2: 'Neutral'  
}
```

Please use the loaded data set and split it into train and evaluation. Create a simple Random Forest classifier and apply it to the dataset train and provide a classification\_report on the validation set. ask me clarification questions:

sent\_valid.csv

as much as possible details 

provide an input file with  
your data 

# Loaded dataset and label distribution

Model: GPT-4

data set  description

label  distribution

Finished working Show work ▾

The dataset consists of two columns:

1. 'text': Contains the text data. It appears to be financial news or comments related to various stock symbols.
2. 'label': Contains the labels for each text instance. The labels are numerical and will be mapped to 'Bearish', 'Bullish', or 'Neutral' as per your instructions.

Let's first check the distribution of the labels.

Finished working Show work ▾

The dataset has the following distribution of labels:

- Neutral: 1566 instances
- Bullish: 475 instances
- Bearish: 347 instances

Next, I will split the data into training and validation sets, create a Random Forest classifier, train it on the training set, and then generate a classification report on the validation set.

# Classification results w/ random forest

**Model: GPT-4**

Finished working Show work ▾

Here is the classification report for the Random Forest classifier on the validation set:

markdown Copy code

	precision	recall	f1-score	support
Bearish	0.57	0.29	0.38	59
Bullish	0.92	0.35	0.51	97
Neutral	0.76	0.97	0.85	322
accuracy			0.76	478
macro avg	0.75	0.54	0.58	478
